

ABSTRACT OF THE DISCLOSURE

A communication device which efficiently dissipates  
5 locally generated heat, and at the same time is small in  
size and light in weight, is provided. A high-efficiency  
heat-dissipating fin section having fins disposed on an  
heat pipe which is bent into an S shape is mounted on a  
high-temperature heat-generating section that generates  
10 high-temperature heat. A heat-dissipating fin section  
having fins disposed on a heat-receiving plate thereof is  
mounted on a low-temperature heat-generating section that  
generates heat having a lower temperature than that of the  
high-temperature heat generated by the high-temperature  
15 heat-generating section. This makes it possible to  
efficiently dissipate heat and reduce the size and weight  
of the communication device.
